

COMPOSITE CYLINDER

If your barbecue has a built-in foot ring (a guide for the base of the barbecue to sit on) you may have noticed that your new composite gas cylinder does not fit neatly on it. That's because barbecues in use today were made with a traditional, steel gas cylinder in mind.

Until the barbecue industry addresses this size and shape variation, we can use a work-around to benefit from the many features of the new, composite cylinders.

Bermuda Gas recommends that, rather than try to squeeze the taller composite into an opening for which it wasn't intended, simply leave the cylinder on the ground next to the barbecue. It's actually too attractive to be covered up anyway!

Remember to always turn off the barbecue and disconnect the cylinder before moving either one.

And, keep on grilling, Bermuda!

NOT FITTING?
